

This file is for setting up, to see how to use the program. go to CONFIG INSTRUCTIONS.pdf

Step 1

Go to: <https://developers.google.com/gmail/api/quickstart/python>

You should see this

The screenshot shows the 'Python Quickstart' page for the Gmail API. The page has a red header with 'Gmail > API' and a search bar. A left sidebar contains a table of contents with links to 'Overview', 'Quickstarts', 'Browser', 'Go', 'Google Apps Script', 'Java', '.NET', 'Node.js', 'PHP', 'Python' (highlighted), 'Ruby', 'Android', 'iOS', 'Create and Send Mail', 'Manage Mailboxes', 'Manage Settings', and 'Filters'. The main content area is titled 'Python Quickstart' and includes a 'Send feedback' button. It describes the goal of creating a simple Python command-line application. Under 'Prerequisites', it lists: Python 2.6 or greater, the pip package management tool, and a Google account with Gmail enabled. 'Step 1: Turn on the Gmail API' instructs the user to click a button to create a new Cloud Platform project and enable the Gmail API. Below this is a blue button labeled 'Enable the Gmail API'. The text continues: 'In resulting dialog click **DOWNLOAD CLIENT CONFIGURATION** and save the file `credentials.json` to your working directory.' 'Step 2: Install the Google Client Library' is partially visible at the bottom.

Step 2

Click on Enable Gmail API

Prerequisites

To run this quickstart, you'll need:

- Python 2.6 or greater
- The [pip](#) package management tool
- A Google account with Gmail enabled

Step 1: Turn on the Gmail API

Click this button to create a new Cloud Platform project and automatically enable the Gmail API:

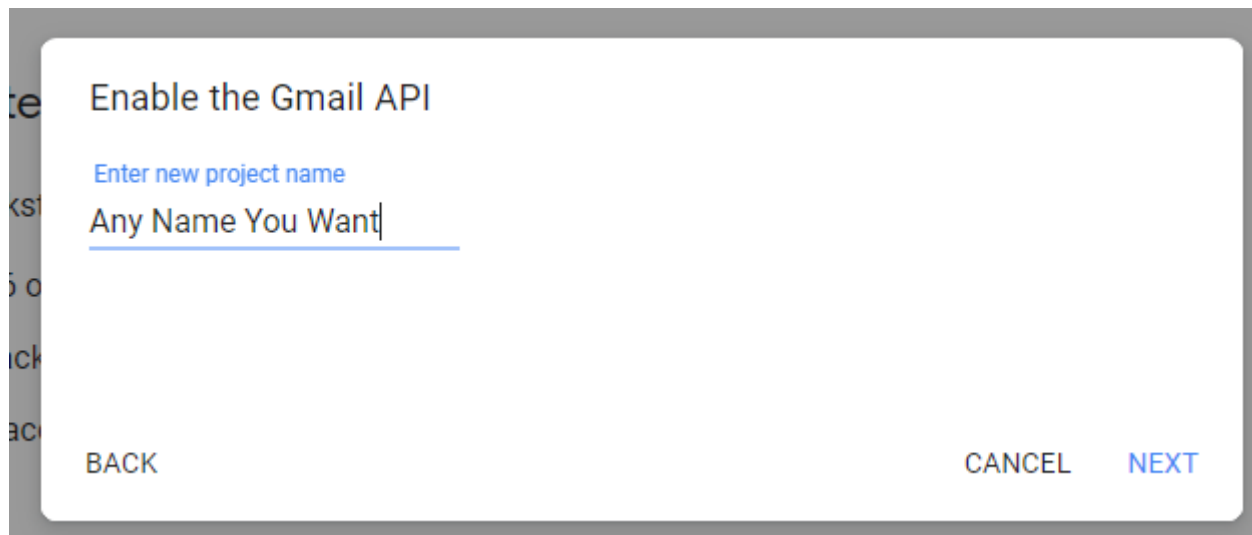

Enable the Gmail API

In resulting dialog click **DOWNLOAD CLIENT CONFIGURATION** and save the file `credentials.json` to your working directory.

Step 2: Install the Google Client Library

Step 3

Enter the project name

Enable the Gmail API

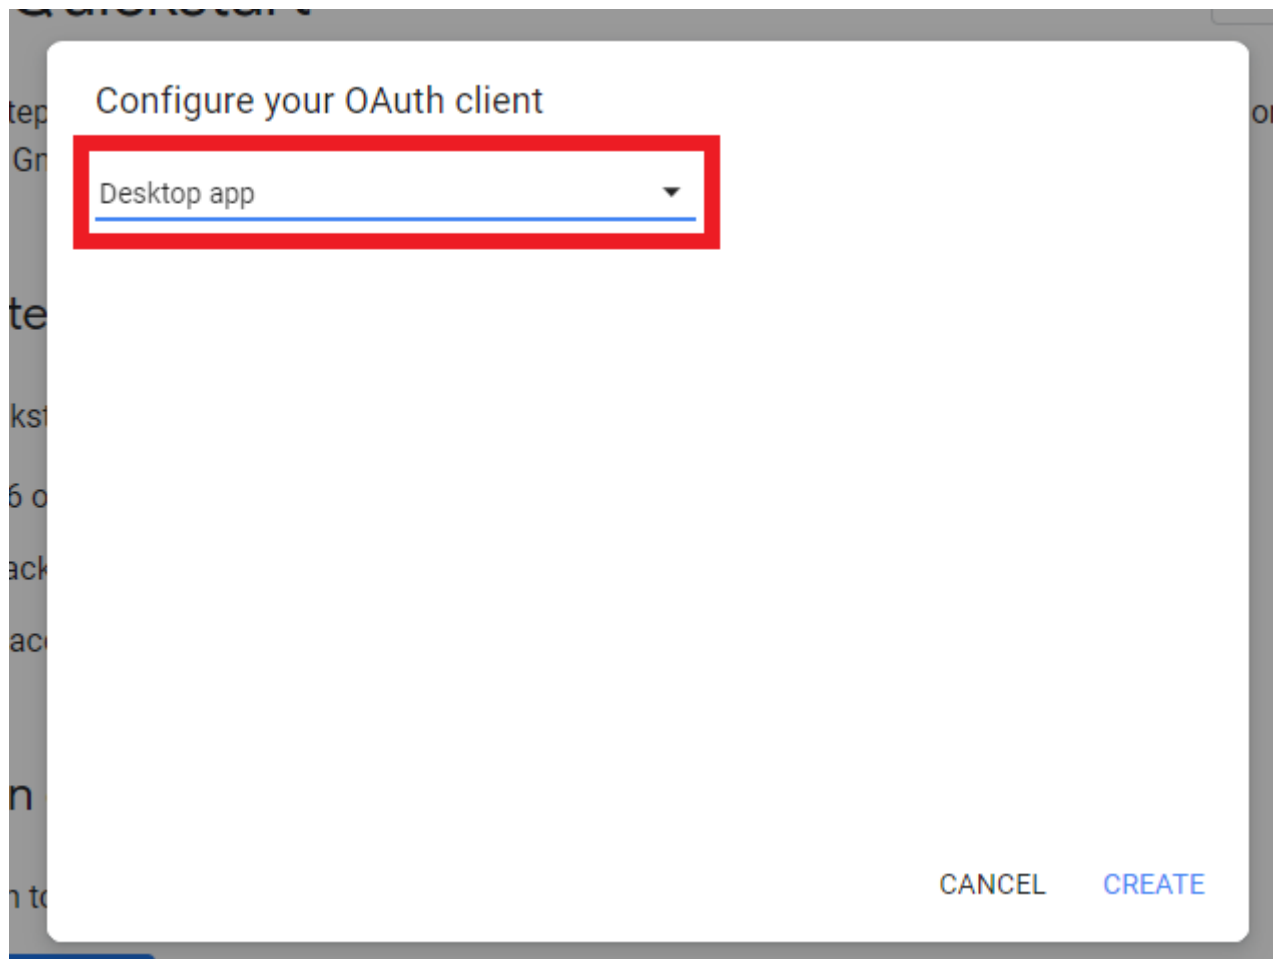

Enter new project name

Any Name You Want

BACK CANCEL NEXT

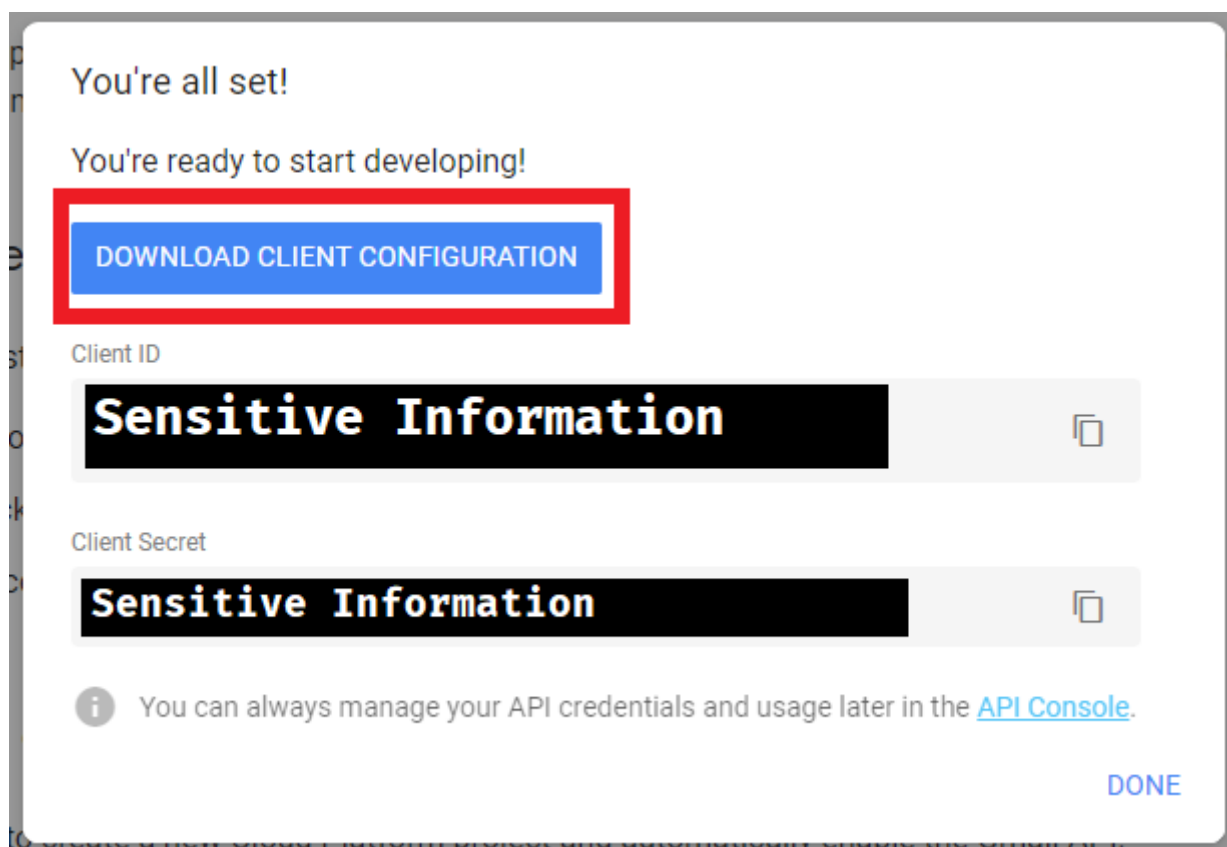

Step 4

Chose Desktop App

Step 5

Download the configuration (Note: This file is very important, keep it secure)

Step 6

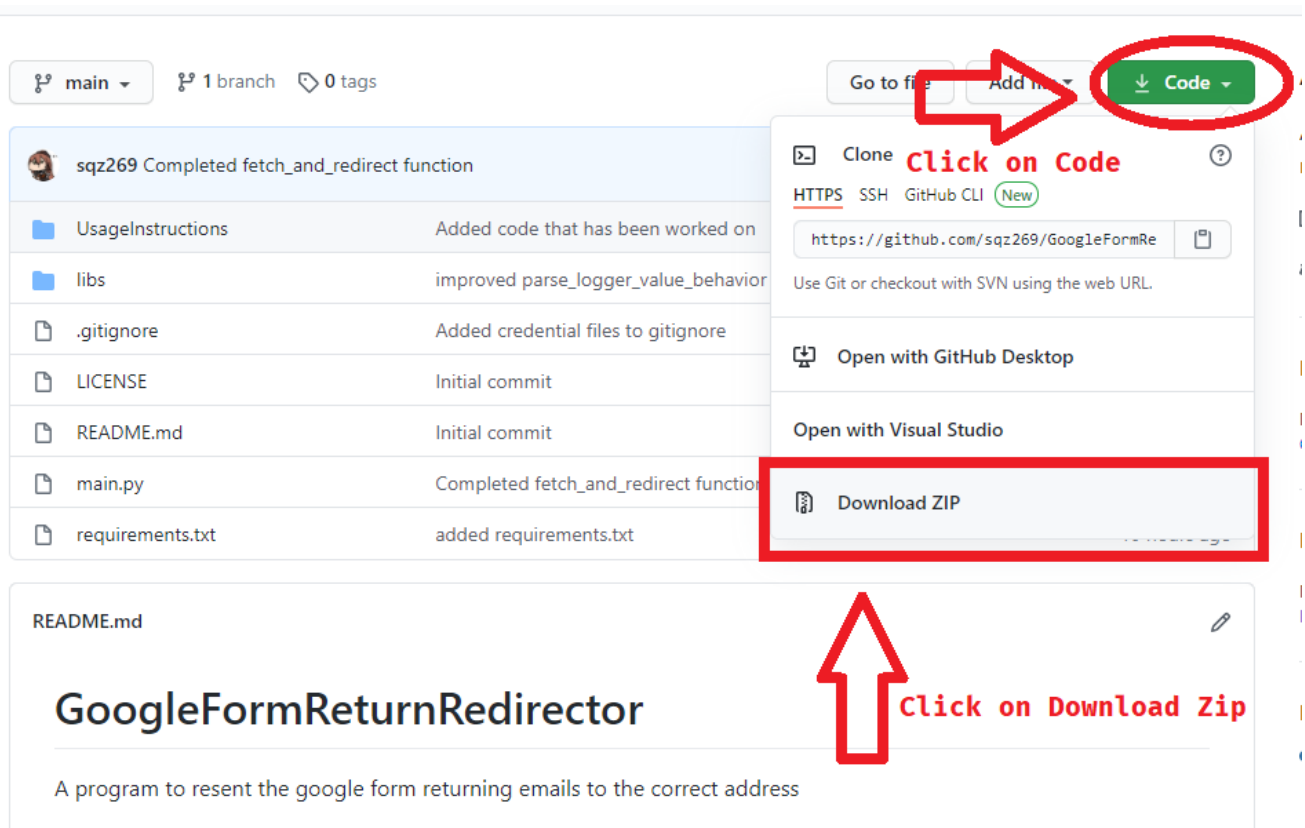

Go to: <https://github.com/sqz269/GoogleFormReturnRedirector>

Now there is two ways of doing this. One by directly downloading a compiled executable from release page (Which I have not done) or download the python environment and execute the script directly using python

Step 6-12 is for directly executing the script, skip to Step 13 for downloading an executable

Step 7

Download the source code

Step 8

Extract the source code

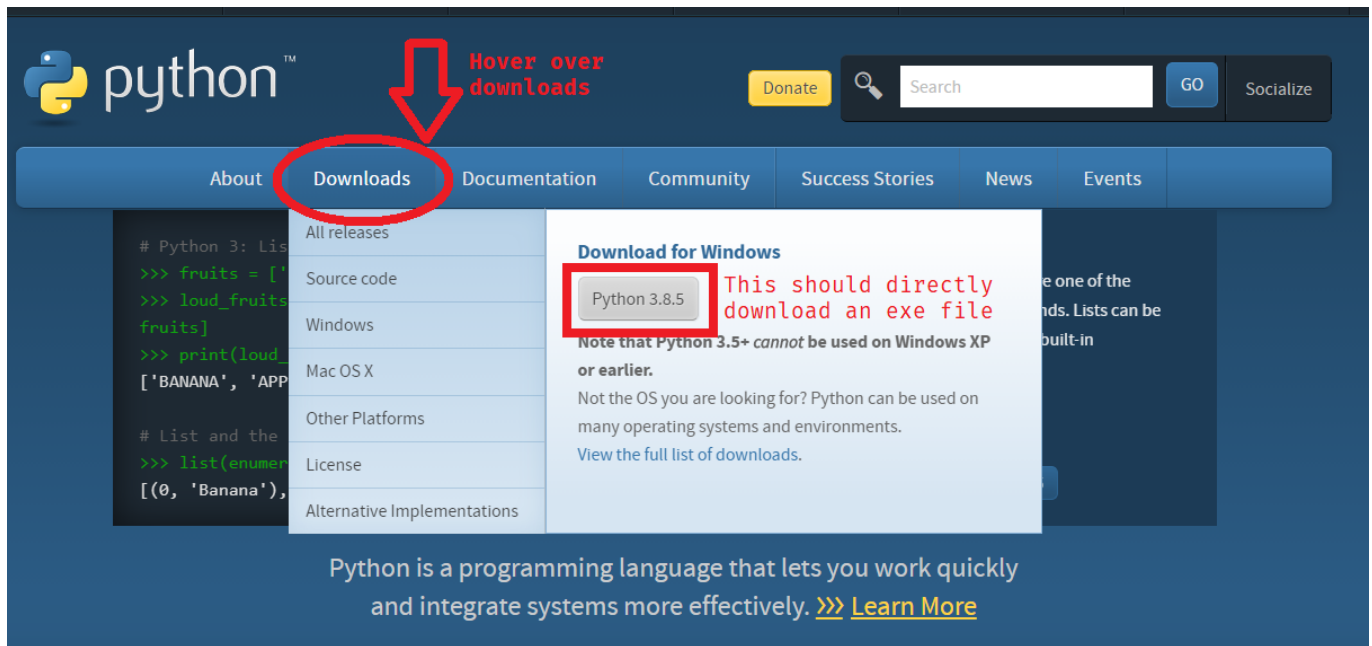

NOTE: Exact extraction procedures depends on your system.

Usually windows 10 will have a *Extract* option when your right click on the folder, but it will depend

Step 9

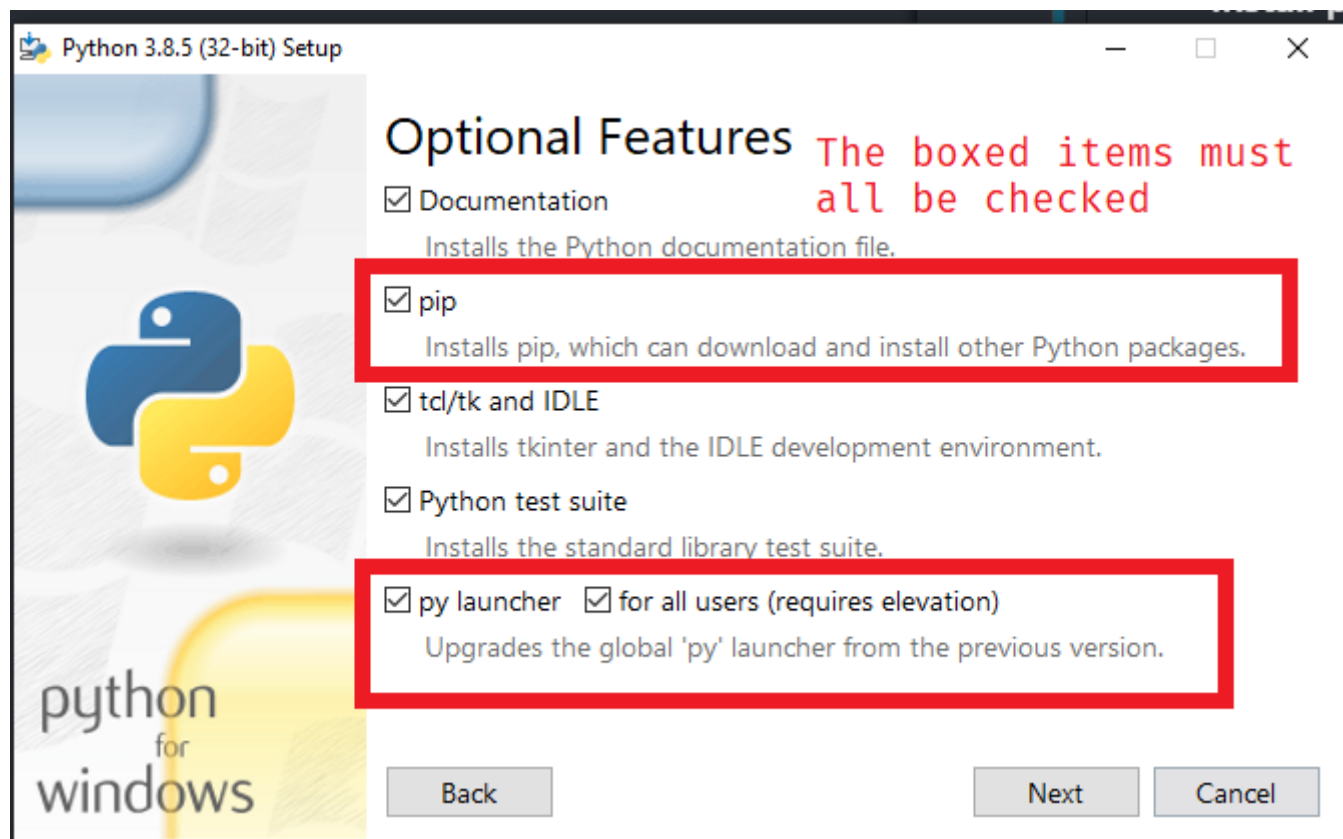

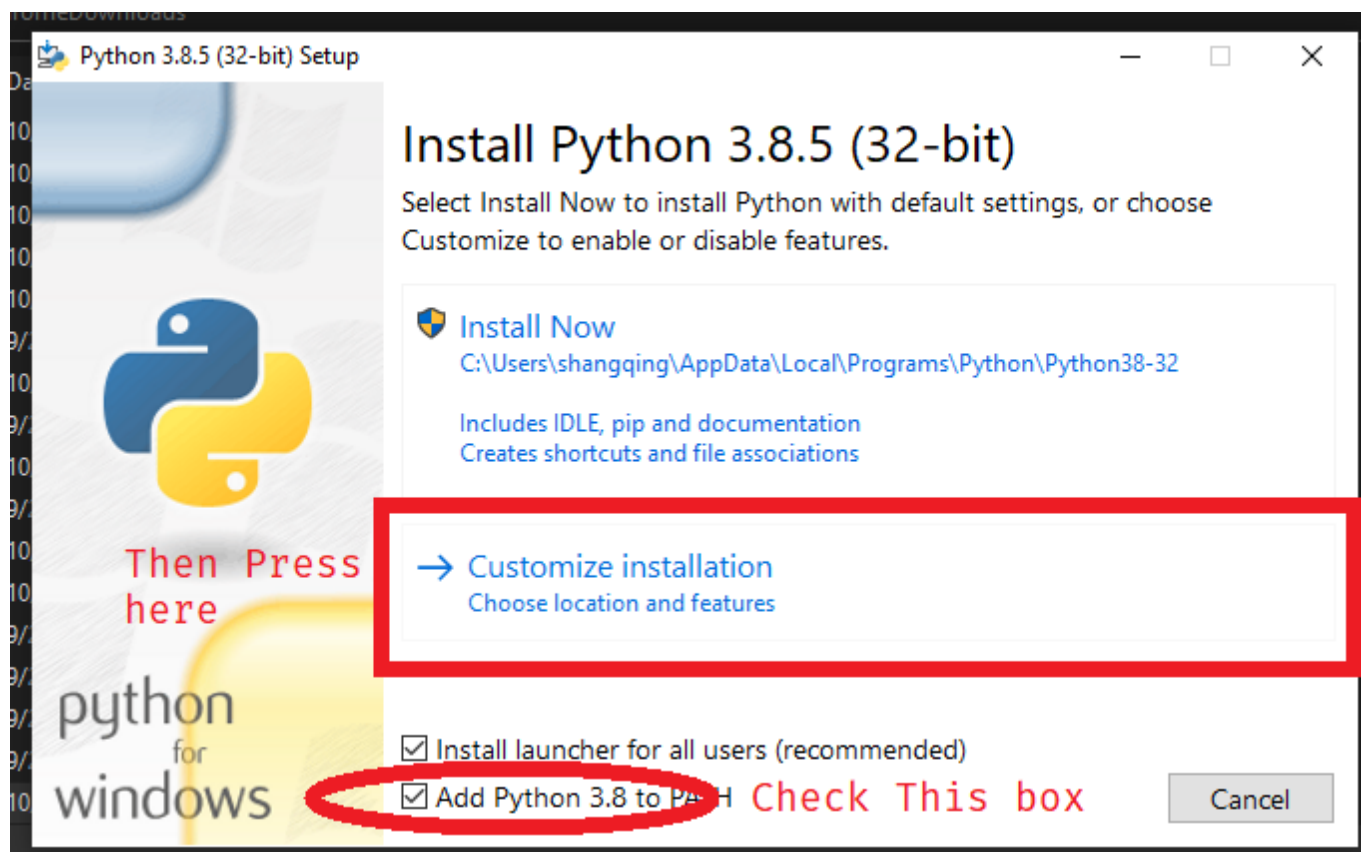

Download python

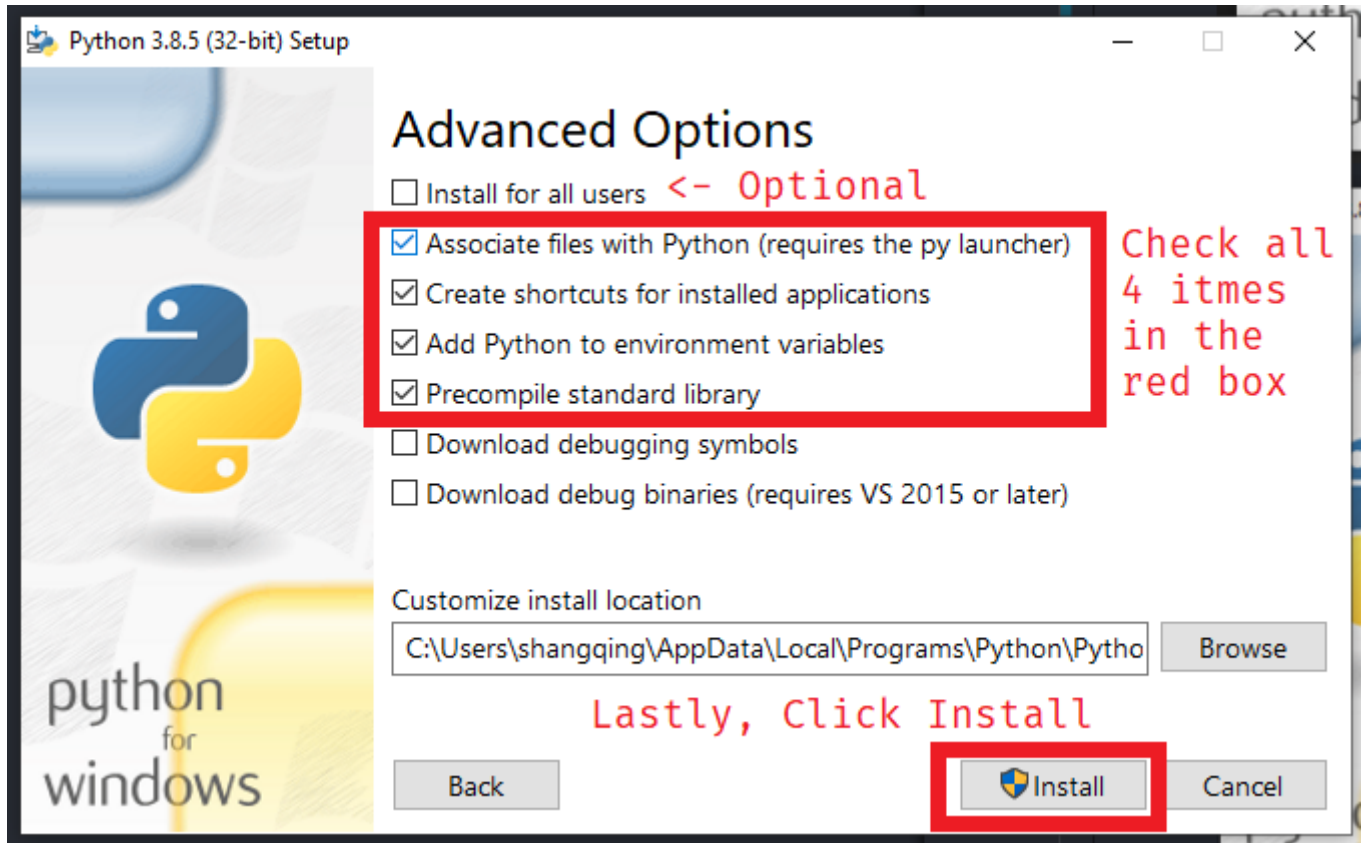

Go to python.org

Step 10

Install python

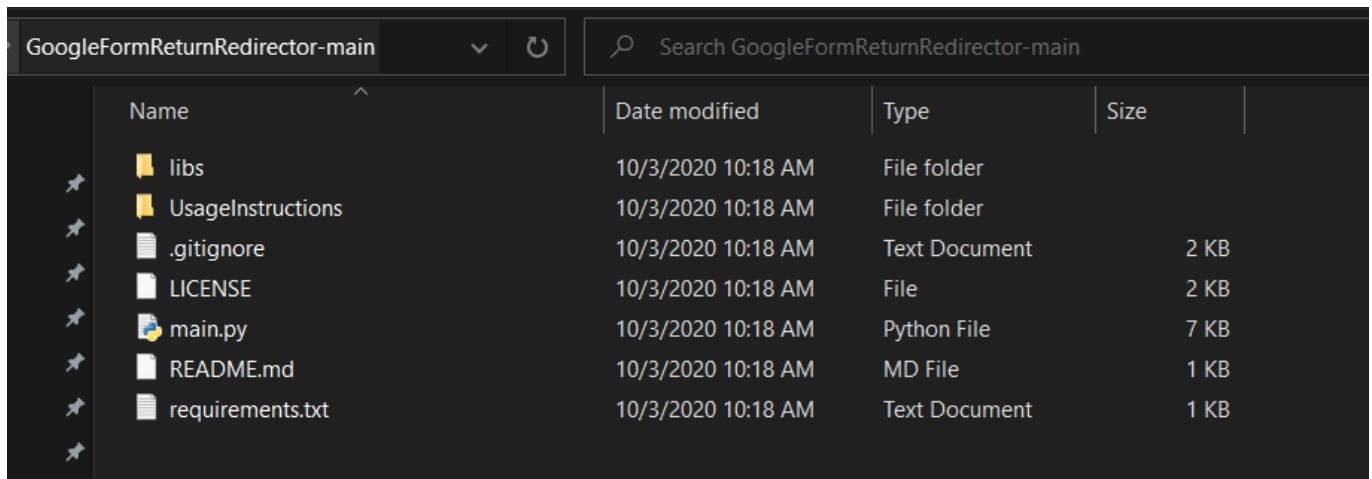

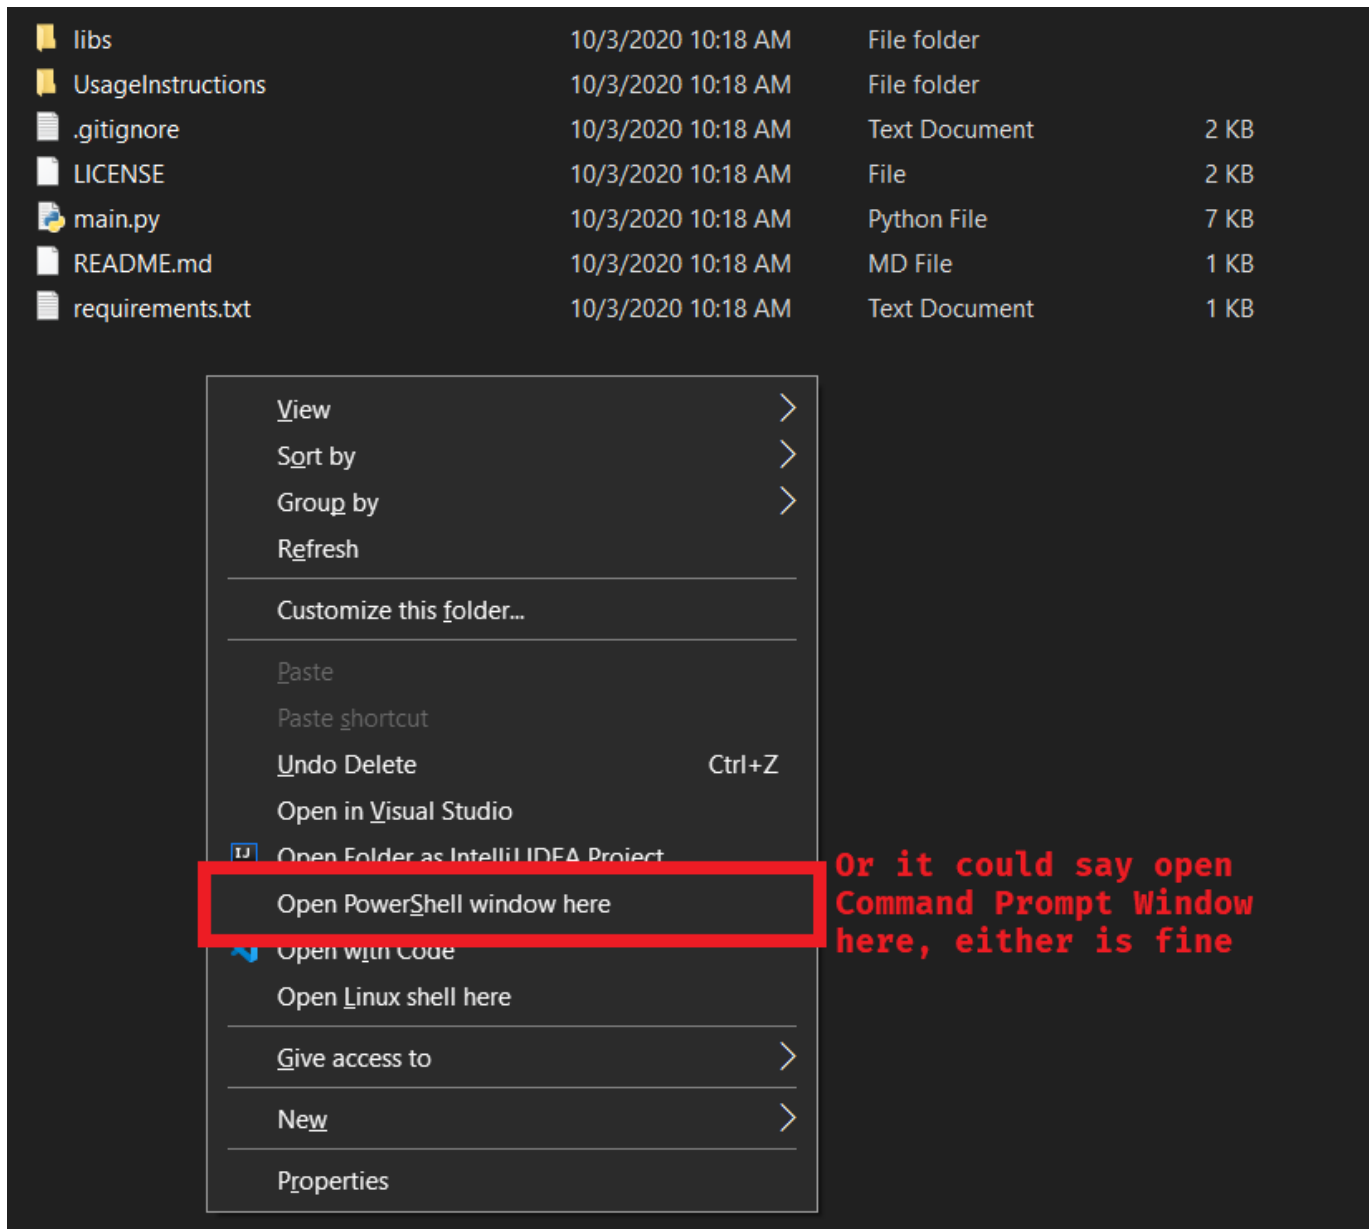

Step 11

Installing to required packages

Navigate to the folder with the source code

Hold **Shift** And Right Click On the folder window and you should see following window (Or something like that)

Click on Open PowerShell window here (or command Prompt window)

You should now see a black/blue window pop up.

Now Enter the following command

```
pip install -r .\requirements.txt --user
```

Wait till it finishes installing, Do not interrupt the process

Step 12

To execute the script, simply type in the Blue/Black window `py main.py`

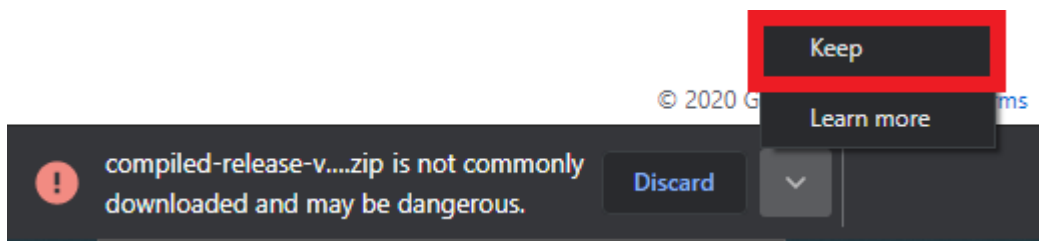

Step 13

NOTE: If you did step 7 - 12, Disregard the following steps

Go to: <https://github.com/sqz269/GoogleFormReturnRedirector/releases>

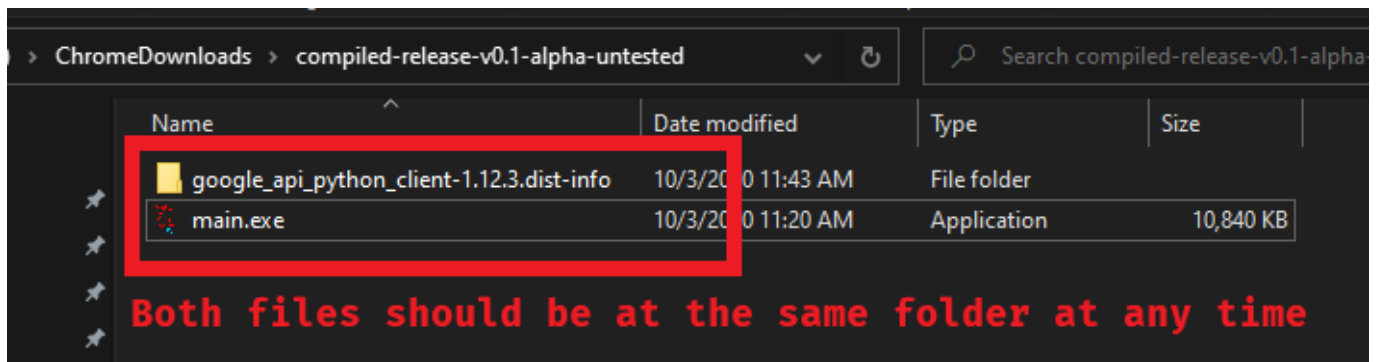

You might see this message. just click on the arrow and keep

Step 14

Extract the downloaded zip file

Step 15

You are done, just run **main.exe** if you need to use it
